## An algorithm that reason about robustness

Introduction

Background 00 Direct Transcription With Ellipsoidal Disturbances

# Contribute

- In the case of ellipsoidal disturbance sets, fast evaluations of robust cost and constraint functions.
- Algorithm that improves tracking performance over non-robust formulations while incurring only
  a modest increase in computational cost.
- Evaluation of the algorithm in several simulated robot control tasks.

## Trajectory optimization via DIRTRAN

Introduction

Background O● Direct Transcription With Ellipsoidal Disturbances

000000

#### Characteristics

- NLP that can be solved using SQP packages such as SNOPT.
- Straight forward inclusion of state constraints and avoid numerical pitfalls such as the "tail wagging the dog" effect.
- · Usually the problem size is large

$$\begin{aligned} & \underset{x_{1:N},\,u_{1:N-1},\,h}{\text{minimize}} \,\,g_N(x_N) + \sum_{i=1}^{N-1} g(x_i,u_i) \\ & \text{subject to} \quad x_{i+1} = x_i + f(x_i,u_i) \cdot h \quad \forall i=1:N-1 \\ & \quad u_i \in \mathcal{U} \qquad \qquad \forall i=1:N-1 \\ & \quad x_i \in \mathcal{X} \qquad \qquad \forall i=1:N \\ & \quad h_{\min} \leq h \leq h_{\max} \end{aligned}$$

Introduction

## State and input deviations

Introduction Background 000 00

Direct Transcription With Ellipsoidal Disturbances

○●○○○○

Assume well defined  $w_i \in W$  disturbances that enter into the dynamics Hence, we can write the disturbed dynamics as

$$x_{i+1} = f_h(x_i, u_i, w_i)$$

Given a disturbance sequence  $w_{1:N-1}$  we can calulate the state and input deviations from the nominal values.

#### Deviations formulation

$$\delta x_{i+1} = f_h(x_i + \delta x_i, u_i + \delta u_i, w_i) - x_{i+1}$$

$$\delta u_i = -K_i \delta x_i$$

Introduction Background 000 00

Direct Transcription With Ellipsoidal Disturbances
○○●○○○

#### Characteristics

- Penalize deviations of the closed-loop system from the nominal trajectory in the presence of disturbances, w<sub>i</sub>.
- Quadratic cost of the form  $\delta x_i^T Q^I \delta x_i + \delta u_i^T R^I \delta u_i$ , where  $Q^I \geq 0$  and  $R^I \geq 0$  are positive semidefinite cost matrices.
- Need of a well-defined disturbance sequence,  $w_{1:N-1}$ .

Robust cost averaged over the entire disturbance set and summed along the trajectory:

$$I_{W}(x_{1:N}, u_{1:N-1}) \approx \frac{1}{Vol(W)} \int_{W} (\delta x_{N}^{T} Q^{l} \delta x_{N} + \sum_{i=1}^{N-1} (\delta x_{i}^{T} Q^{l} \delta x_{i} + \delta u_{i}^{T} R^{l} \delta u_{i})) dW$$

but this integral cannot be easily computed.

Introduction Background

Direct Transcription With Ellipsoidal Disturbances 000●00

#### Assumptions

 $\bullet$  Parametrization of the ellipsoidal set W by a symmetric positive-definite matrix D, such that

$$w^T D^{-1} w \leq 1$$

• Parametrization of the ellipsoidal bounds on the state deviations  $\delta x_i$  by a symmetric positive-definite matrix  $E_i$ , such that

$$\delta x_i^T E_i^{-1} \delta x_i \leq 1$$

Linearization of the disturbed dynamics around the nominal trajectory:

$$\delta x_{i+1} \approx A_i \delta x_i + B_i \delta u_i + G_i w$$

Thanks to the previous assumptions we can write the robust cost as:

$$I_W(x_{1:N}, u_{1:N-1}) = Tr(Q_N^I E_N) + \sum_{i=1}^{N-1} Tr((Q^I + K_i^T R^I K_i) E_i)$$

## The DIRTREL Algorithm

Introduction

Background OO Direct Transcription With Ellipsoidal Disturbances

○○○●○

Examples 000000

In addition to augmenting the DIRTRAN optimization problem with  $l_W(x_{1:N}, u_{1:N-1})$ , we must also ensure that the closed-loop system obeys state and input constraints.

#### Robust state constraints

$$x_i^W = x_i \pm col(E_i^{1/2})$$

#### Robust input constraints

$$u_i^W = u_i \pm col((K_i E_i K_i^T)^{1/2})$$
